

## VideoMost Named High Performer in Multiple Categories in G2's 2024 Summer Reports

July 29, 2024

VideoMost, online business communications software that includes messenger and group video calls, has been recognized as a High Performer in two G2's 2024 Summer Reports categories: Video Conferencing Software and Business Instant Messaging Software.

G2 is the world's premier software marketplace, with over 60 million users turning to it to make informed software choices, guided by genuine peer reviews. The G2 Grid®, a widely respected industry benchmark, evaluates technology solutions based on user feedback, market presence, and overall customer satisfaction. There are four categories in which products are ranked: Leaders, High Performers, Contenders, and Niche.

Being included in the High Performing category on the Grid®, VideoMost received glowing customer satisfaction scores and recognition among corporate communication software users. This acknowledgment is the result of genuine user feedback gathered through the G2 review process and based on diverse factors, such as ease of setup, usability, quality of support, likelihood to recommend, and more.

VideoMost has established itself in the Asia Pacific and Indian software markets as both a video conferencing product and a Video Platform as a Service (VPaaS). In the 'Trending Products' category, including the Momentum Grid® Reports for 'Video Conferencing' and 'Business Instant Messaging', VideoMost has secured strong positions, resulting from high customer ratings and satisfaction.

"Our team is delighted by VideoMost's recognition as a High Performer in G2's latest reports. This achievement reflects our ongoing dedication to delivering cutting-edge solutions that empower organizations worldwide," said Alex Kravchenko, Vice President of VideoMost.

VideoMost is a powerful and secure enterprise-grade communication platform that supports remote work from any device and network. As an alternative to well-known solutions, such as Zoom and Teams, VideoMost enables telcos, service providers, and software developers to deliver high-quality, secure, and self-hosted messaging and group video meeting services to their clients.

By securely storing all information—voice, video, text, files, screen sharing, chat messages, and recordings—within the organization, rather than in a cloud, VideoMost ensures digital independence from cloud-based communication services. The product is licensed as an SDK in many countries worldwide.
